# GENFARM Universal Spatial Intelligence OS

the business model should mirror the product architecture itself:

> **one spatial core + optional intelligence modules + higher-value automation/integration layers.**

That is stronger than selling "four versions of the same software." The tiers become **pre-bundled configurations**, while the real commercial engine is the modular bolt-on system.

The most important thing is not to trap Genesis Farm inside the current Raynham feature set. Raynham is the proving ground. **Genesis Farm is the reusable product architecture.**

A clean positioning line would be:

> **Genesis Farm is a configurable spatial intelligence platform for farms and estates — mapping people, places, assets, issues and operations in one adaptable system.**

I would avoid saying "the only system out there" until we have done a proper competitor sweep. The stronger defensible claim for now is **configurable, modular and spatial-first**.

## Recommended commercial architecture

| Tier | Position | Core capability | Best for | Indicative monthly range* |
|---|---|---|---|---|
| **Genesis Map** | Spatial foundation | Estate map, zones, locations, QR tagging, reports, notices, basic mobile field reporting | Small farms / first-time digitisation | **£195–£295** |
| **Genesis Operations** | Run the estate | Everything in Map + personnel check-ins, lone-worker workflows, asset records, incidents, cases, evidence, work tracking | Working farms and estates | **£395–£595** |
| **Genesis Intelligence** | Understand + automate | Everything in Operations + Universal Intelligence Cards, traffic-light intelligence, clock-in/out, department cards, ARIA, automations, advanced operational summaries | Larger estates / multi-department operations | **£795–£1,195** |
| **Genesis Enterprise** | Configure the whole organisation | Multi-site, custom workflows, advanced permissions, integrations, bespoke modules, implementation support | Large estates, agribusinesses, multi-site operators | **£1,500+ / custom** |

*These are starting commercial hypotheses, not market-validated prices yet.

The key is that **Genesis Map is always the foundation**. Every other product is an extension of that same spatial layer.

---

## Tier 1 — Genesis Map

This should be the deliberately simple entry product.

It gives customers the immediate “aha” moment:

> **I can finally see my operation spatially.**

I would include the things you can already credibly demonstrate:

**Spatial estate/farm map** with configurable areas such as fields, buildings, yards, zones and departments.

**Locations and QR anchors** so gates, sheds, pumps, machinery points and other physical estate objects can have a digital identity.

**Mobile field reporting** from phone/URL/QR.

**Reports and notices** attached to place.

**Basic risk-zone visibility.**

**Satellite / street / terrain views.**

**Basic search.**

**Mobile-responsive field interface.**

This tier should not include advanced personnel intelligence, timekeeping or heavy automation.

It is essentially:

> **Digitise your farm spatially.**

And this is important commercially because it creates a low-friction entry point.

---

# Tier 2 — Genesis Operations

This is where the product becomes an operational system rather than a map.

This tier would include what Raynham is already moving toward and what you can largely demonstrate today.

Add:

**Personnel safety and explicit check-ins**

Not continuous tracking claims — genuine recorded location/check-in states.

**Lone-worker functionality**

- start lone work
- expected finish
- check-ins
- last-known location
- emergency/help flows
- attention states

**Incident management**

Your current architecture already has:

- reports
- enhanced incidents
- cases
- evidence records
- SLA fields
- human triage

So this is commercially meaningful.

**Asset register**

Vehicles, equipment, gates, pumps, machinery, etc.

**Work / case tracking**

Report → incident → work/case → resolution.

**Evidence trail**

Photos, notes, decisions and resolution.

**Operational mobile cards**

Current staff, asset and issue states without the full Universal Intelligence Card system yet.

This package is:

> **See what is happening and manage what needs doing.**

---

# Tier 3 — Genesis Intelligence

This should be where the real differentiation starts.

And I would place your **Universal Intelligence Card system and QR clock-in/clock-out** here.

This is not merely "more features."

It introduces an **intelligence layer** across everything.

## Universal Intelligence Cards

Every person, place, asset, job, department or livestock group can have:

- operational state
- intelligence state
- location

- last update
- activity
- related issues
- next action
- history

with the shared:

**Green = normal**
**Amber = attention**
**Red = act now**
**Grey = inactive**

This could become one of the defining visual/product features of Genesis Farm.

## Personnel Intelligence

This is where you add:

- QR clock-in/out
- digital attendance
- shifts
- breaks
- Who’ s On Farm
- department
- current activity
- location freshness
- recent work context
- attendance exceptions
- timesheet output

## Department Intelligence

Farm & Land

Livestock

Grounds

Property

Hospitality

or whatever the customer configures.

Each department gets its own intelligence state.

### ARIA intelligence

ARIA should live more strongly here.

Not just chatbot access.

Things like:

> “What requires attention today?”
>
> “Show me unresolved issues around North Farm.”
>
> “Who is currently lone working?”
>
> “Which assets have repeat faults?”
>
> “Summarise this week’ s operational issues.”

### Advanced automations

Once proven:

- incident classification
- case creation
- urgency workflows
- escalations
- SLA monitoring
- recurring issue detection

But I would be disciplined here.

The Taskade audit is correct: some of those automations are **configured but not proven**, while SLA monitoring and spatial clustering are not currently ready to sell as functioning features.

So the sales architecture should distinguish:

> **Included and live**

from

> **coming through the Intelligence automation layer**

until they have passed production testing.

---

## Tier 4 — Genesis Enterprise

This is less about another pile of features and more about:

> **Make Genesis Farm fit our operation.**

This is where the modular proposition becomes powerful.

Enterprise customers could receive:

**Multi-site / multi-estate operations**

One organisation with:

- Farm A
- Farm B
- Estate
- forestry operation
- hospitality site

and different access scopes.

**Advanced permissions**

Manager

Farm manager

Supervisor

Worker

Contractor

Payroll/admin

Owner

**Custom workflow modules**

Different farms operate differently.

One may care heavily about livestock.

Another may be arable.

Another estate may include:

- property
- events
- cottages
- hospitality
- forestry
- livestock

Genesis Farm shouldn't force the same workflow onto all of them.

**Custom integrations**

Eventually:

- NoFence
- Xero
- weather
- accounting/payroll
- IoT
- machinery telemetry
- livestock systems
- contractor systems

**Custom intelligence**

Bespoke ARIA knowledge, workflows and reporting.

**Implementation support**

Mapping the farm

Importing assets

Creating QR tags

Setting departments

Building permissions

Training staff

Creating workflows

That professional-services layer can be significant revenue.

---

## The real money is in the modules

This is the part I think is particularly strong.

Rather than only:

> Basic / Pro / Premium

Genesis Farm can operate like:

> **Base platform + choose what your farm needs.**

For example, a customer buys **Genesis Map** for £249/month.

Then adds:

**People & Safety**
+£99–£149/month

**Time & Attendance**
+£99–£199/month

**Asset Intelligence**
+£99–£149/month

**Livestock Intelligence**
+£149–£249/month

**ARIA Intelligence**
+£149–£299/month depending on AI usage

**Compliance & SLA**
+£99–£199/month

**Contractor Management**
+£79–£149/month

**Advanced Integrations**
from +£99/month plus setup

Those aren't final prices yet — but that is the model I would test.

It gives you two buying routes:

> **Choose a package**

or

> **Build your own Genesis Farm**

That second one is highly aligned with the brand promise.

---

# I would define the modules like this

The product architecture becomes:

**Genesis Spatial Core**

then optional:

**People**
Personnel, presence, safety, lone working.

**Time**
Clock-in/out, attendance, breaks, timesheets.

**Assets**
Equipment, vehicles, machinery, inspections, faults.

**Work**
Reports, jobs, incidents, cases, evidence.

**Livestock**
Groups, location, counts, water, welfare, NoFence later.

**Land**
Fields, boundaries, gates, risks, inspections.

**Contractors**
Check-in, briefing, assignment, access, audit trail.

**Intelligence**
ARIA, briefs, traffic lights, pattern recognition, automation.

**Integrations**
Xero, NoFence, external APIs, IoT.

That is much more extensible than having twenty different standalone products.

---

## There should also be an onboarding fee

I would definitely not make this a £99/month self-serve tool with zero implementation revenue.

The system gets dramatically more valuable once you configure the actual farm.

You need to:

- map the estate
- define departments
- add fields/zones
- create anchors
- upload assets
- create personnel
- configure QR codes
- set safety rules
- establish workflows
- configure permissions

That is a service.

Potential setup structure:

**Genesis Map Setup**
from roughly **£1,000–£2,500**

**Genesis Operations Setup**
roughly **£2,500–£5,000**

**Genesis Intelligence / Enterprise implementation**
**£5,000–£15,000+**

depending on complexity.

That gives Agnello/Genesis Farm both:

**recurring SaaS revenue**

and

**implementation / consultancy revenue.**

And importantly, implementation makes the SaaS sticky.

Once a farm has:

- mapped every important location
- tagged assets
- created QR codes
- loaded personnel
- built workflows
- established history

switching becomes much harder.

---

# Avoid unlimited AI

This is one lesson I would immediately take from the Raynham build.

Your Taskade audit says two SLA monitoring automations failed because the workspace reached its monthly AI usage limit.

That means Genesis Farm should **not promise unlimited AI inside a flat subscription**.

ARIA could instead have:

## Intelligence allowance

For example:

**Operations**
Limited ARIA usage.

**Intelligence**
Higher monthly AI allowance.

**Enterprise**
Custom allowance / fair-use or metered.

And if customers exceed it:

> additional Intelligence Credits

You don't necessarily expose Taskade credits to them.

Genesis Farm can have its own commercial abstraction:

> **Genesis Intelligence Usage**

That protects your margin.

---

# I would also separate "verified" from "roadmap"

This matters a lot.

Your commercial page should initially say:

## Available now

Spatial maps

QR locations

Field reporting

Notices

Safety check-ins

Last-known position

Lone-worker workflows

Incidents

Evidence records

ARIA assistance

Estate operations interface

## Advanced modules rolling out

Universal Intelligence Cards

Clock-in/out

Department Intelligence

Personnel Intelligence

Asset checkout

Contractor intelligence

### Future intelligence

Automated hotspot detection

Advanced SLA monitoring

Automated risk-zone generation

External livestock telemetry

advanced predictive operations

That stops sales from getting ahead of the product.

---

## Customer examples become very easy

### Small livestock farm

Genesis Map

- Livestock
- People & Safety

### Large arable farm

Genesis Operations

- Assets
- Contractor Management

### Large estate like Raynham

Genesis Intelligence

- People
- Time
- Assets
- Work

- Hospitality/Property
- ARIA

### Multi-site agricultural group

Genesis Enterprise

- integrations
- custom permissions
- multiple sites
- custom workflows

Same platform.

Different configuration.

That is exactly the commercial story you're after.

---

## The strongest way to position Genesis Farm

I wouldn't lead with:

> Farm management software.

That's an overcrowded category and undersells what you're creating.

I would lead with:

## The spatial operating system for modern farms.

Then:

> **Map it. Tag it. Track it. Understand it.**

Or:

> **One map. Every operation.**

And the fuller proposition:

> **Genesis Farm is a modular spatial intelligence platform that connects your people, land, assets, livestock, work and risk in one configurable operating system. Start with the map, then add the intelligence your operation needs.**

That last sentence also explains the business model:

> **Start with the map. Add what you need.**

I think that should almost become the commercial architecture of the whole company.

Raynham proves the platform.

Genesis Farm becomes the product.

And the moat isn't simply one clever feature — it becomes the **configurable spatial data model + intelligence-card system + modular operational layer + accumulated farm history.**
